

MobileTrak5[®] Electronic Aisle Locks

The latest in security devices for our MobileTrak5[®] Systems, we introduce the Electronic Aisle Lock. This electronic locking mechanism requires a code to unlock it. Without this code, the lock renders the carriage it's installed on immovable. Slide this carriage into the rest and lock it to prevent your system from being accessed.

The system works like this: the locking mechanism is attached to the carriage. When the code is entered on the keypad and the lock is disengaged, the metal lock bar lifts from the floor plate in the track to allow the carriage to move freely, opening up the system.

- 4 digit code required to unlock the system.
- Master code can be used to override the lock.
- Can be installed on new or pre-existing units.
- Battery powered so power failures won't compromise security.
