

File Folder Label Printing System Part # ISB3295

Virtual Labels prints file folder labels that are customized to each customer's specific requirements. A file name or number can be color-coded, so that 'blocks of color' form when folders are stored on library-style 'open' shelving. This helps eliminate misfiles and speeds file pulls and re-files.

Label designs can include multiple text fields for quick-reference, and multiple color designators to differentiate file types, time periods or other classifications.

Customized data entry screens correspond to the information printed on the label, and data can be imported from host database(s) or spreadsheets with one-click to eliminate the need for keyboard entry.

Labels can include bar code(s) and/or radio frequency transmitters, and the software can be upgraded to file tracking at any time.
